

Principle of Superposition

Introduction

Principle of superposition is the very first property that a linear system has.

Proof

For a given solid mechanics problem with two independent sets of boundary conditions:

$(\sigma_x, \sigma_y, \sigma_z, \tau_{xy}, \tau_{yz}, \tau_{zx})$ $(\epsilon_x, \epsilon_y, \epsilon_z, \gamma_{xy}, \gamma_{yz}, \gamma_{zx})$ (u, v, w) are unknown variables, others are known.

$$\text{Equilibrium } \operatorname{div}(\boldsymbol{\sigma}) + \mathbf{f} = \mathbf{0}, \boldsymbol{\sigma} = \boldsymbol{\sigma}^T$$

$$\text{Constitutive Law } \boldsymbol{\epsilon} = \mathcal{C} : \boldsymbol{\sigma}$$

$$\text{Deformation Continuity } \boldsymbol{\epsilon} = \frac{1}{2} (\nabla \mathbf{u} + \mathbf{u} \nabla)$$

Boundary Conditions:

Set 1

$$\begin{cases} \mathbf{u}(x) = \mathbf{u}_1 & \text{on } \Gamma_u \\ \boldsymbol{\sigma} \cdot \mathbf{n} = \mathbf{q}_1 & \text{on } \Gamma_q, \Gamma_u + \Gamma_q = \partial\Omega \\ \mathbf{f} = \mathbf{f}_1 & \text{in } \Omega \end{cases}$$

Solution 1

$$\begin{cases} \mathbf{u}_1 = \mathbf{u}_1 \\ \boldsymbol{\epsilon}_1 = \boldsymbol{\epsilon}_1 \\ \boldsymbol{\sigma}_1 = \boldsymbol{\sigma}_1 \end{cases}$$

Set 2

$$\begin{cases} \mathbf{u}(x) = \mathbf{u}_1 & \text{on } \Gamma_u \\ \boldsymbol{\sigma} \cdot \mathbf{n} = \mathbf{q}_2 & \text{on } \Gamma_q, \Gamma_u + \Gamma_q = \partial\Omega \\ \mathbf{f} = \mathbf{f}_2 & \text{in } \Omega \end{cases}$$

Solution 2

$$\begin{cases} \mathbf{u}_2 = \mathbf{u}_2 \\ \boldsymbol{\epsilon}_2 = \boldsymbol{\epsilon}_2 \\ \boldsymbol{\sigma}_2 = \boldsymbol{\sigma}_2 \end{cases}$$

Then for the boundary conditions:

Set 1+2

$$\begin{cases} \mathbf{u}(x) = \mathbf{u}_1 + \mathbf{u}_2 & \text{on } \Gamma_u \\ \boldsymbol{\sigma} \cdot \mathbf{n} = \mathbf{q}_1 + \mathbf{q}_2 & \text{on } \Gamma_q, \Gamma_u + \Gamma_q = \partial\Omega \\ \mathbf{f} = \mathbf{f}_1 + \mathbf{f}_2 & \text{in } \Omega \end{cases}$$

Solution 1+2

$$\begin{cases} \mathbf{u}_{1+2} = \mathbf{u}_1 + \mathbf{u}_2 \\ \boldsymbol{\epsilon}_{1+2} = \boldsymbol{\epsilon}_1 + \boldsymbol{\epsilon}_2 \\ \boldsymbol{\sigma}_{1+2} = \boldsymbol{\sigma}_1 + \boldsymbol{\sigma}_2 \end{cases}$$

Verify:

$$\text{Equilibrium } \operatorname{div}(\boldsymbol{\sigma}) + \mathbf{f} = \mathbf{0}$$

$$\operatorname{div}(\boldsymbol{\sigma}_{1+2}) + \mathbf{f}_{1+2} = [\operatorname{div}(\boldsymbol{\sigma}_1) + \mathbf{f}_1] + [\operatorname{div}(\boldsymbol{\sigma}_2) + \mathbf{f}_2] = \mathbf{0}$$

$$\text{Constitutive Law } \boldsymbol{\epsilon} = \mathcal{C} : \boldsymbol{\sigma}$$

$$\boldsymbol{\epsilon}_{1+2} = \boldsymbol{\epsilon}_1 + \boldsymbol{\epsilon}_2 = \mathcal{C} : \boldsymbol{\sigma}_1 + \mathcal{C} : \boldsymbol{\sigma}_2$$

$$\text{Deformation Continuity } \boldsymbol{\epsilon} = \frac{1}{2}(\nabla \mathbf{u} + \mathbf{u} \nabla)$$

$$\boldsymbol{\epsilon}_{1+2} = \boldsymbol{\epsilon}_1 + \boldsymbol{\epsilon}_2 = \frac{1}{2}(\nabla \mathbf{u}_1 + \mathbf{u}_1 \nabla) + \frac{1}{2}(\nabla \mathbf{u}_2 + \mathbf{u}_2 \nabla)$$

Boundary Conditions

$$\begin{cases} \mathbf{u} = \mathbf{u}_{1+2} = \mathbf{u}_1 + \mathbf{u}_2 & \text{on } \Gamma_u \\ \boldsymbol{\sigma} \cdot \mathbf{n} = \mathbf{q}_{1+2} = \mathbf{q}_1 + \mathbf{q}_2 & \text{on } \Gamma_q, \Gamma_u + \Gamma_q = \partial\Omega \\ \mathbf{f} = \mathbf{f}_{1+2} = \mathbf{f}_1 + \mathbf{f}_2 & \text{in } \Omega \end{cases}$$

For problems with two different boundaries (Γ_u, Γ_q), the boundary conditions of each set need to be treated inversely so that the stress/displacement of a set matches the others on boundaries.
